Mr. Tim Abrams, Assistant Engineer  
NYSDEC Region 5, Division of Air  
232 Golf Course Road  
Warrensburg, New York 12885

Re: *Air Permit Modification Request*  
*Air Title V Facility Permit ID No.: 5-5344-00001/00016*  
*Wheelabrator Hudson Falls LLC, Village of Hudson Falls, NY Facility*  
*C.T. Male Project No.: 19.9051*

Dear Mr. Abrams:

On behalf of Wheelabrator Hudson Falls LLC (Wheelabrator), C.T. Male Associates Engineering, Surveying, Architecture, Landscape Architecture & Geology, D.P.C. (C.T. Male) has prepared the attached permit modification application relative to complying with the requirements of 6 NYCRR Part 219-10, NO<sub>x</sub> RACT. The facility's existing Air Title V Permit will remain otherwise unchanged with respect to all other conditions unrelated to NO<sub>x</sub>. Wheelabrator most recently submitted a Final NO<sub>x</sub> RACT Analysis in December 2021 to meet the requirements of NO<sub>x</sub> RACT for its Municipal Waste Incineration Units, and this modification will be the mechanism to incorporate the information into the facility's air permit. A copy of the NO<sub>x</sub> RACT Analysis is attached to the Permit Modification Application.

With respect to the current Air Title V Permit, Conditions 25 and 72 regulate operations with respect to NO<sub>x</sub> limits on MSW combustion. The application document includes additional requirements to modify the MAP limit and the alternative Annual NO<sub>x</sub> limit and 24-hour short term NO<sub>x</sub> limit. As no other changes to the permit are necessary at this time, this application includes only those modified permit conditions relative to the NO<sub>x</sub> limitations. Wheelabrator has submitted their 2021 Emission Statement within the past month documenting annual emissions from the facility and can provide additional emissions information if required.

If you have any questions or require additional information, please contact this office at (518) 786-7400 or via email at [j.farron@ctmale.com](mailto:j.farron@ctmale.com) or [j.marx@ctmale.com](mailto:j.marx@ctmale.com). As with the previous correspondence, the facility contact is Robert Brynes, Senior Manager, Environmental Compliance, who can be reached at (518) 747-2390 Extension 217 or via email at [rbrynes@win-waste.com](mailto:rbrynes@win-waste.com).

C.T. MALE ASSOCIATES

**Project Description**  Continuation Sheet(s)

The permit modification entails incorporating new conditions relative to demonstration of NOx RACT for the facility. Wheelabrator has submitted a RACT demonstration confirming the current NOx control technology employed at the facility is RACT given the inherently low NOx emissions that are already being achieved and that the cost of further NOx reductions greatly exceeds NYDEC's established RACT implementation policy. Wheelabrator Hudson Falls is committing to an alternative annual NOx limit of 165 ppmv, dry corrected to 7% oxygen and 24-hour short term limit of 185 ppmv, dry corrected to 7% oxygen for each MWC unit and annual MAP limit of 275 tons/year, 12-month rolling average for the facility. These lower limits will reduce the facility's potential to emit and ensure that the NOx control technology employed at the facility controls future NOx emissions consistent with the requirements of RACT.

**Facility Description**  Continuation Sheet(s)

**Compliance Statements (Title V Applications Only)**

I certify that as of the date of this application the facility is in compliance with all applicable requirements.  Yes     No  
 If one or more emission units at the facility are not in compliance with all applicable requirements at the time of signing this application (the 'NO' box must be checked), the noncomplying units must be identified in the "Compliance Plan" block on page 8 of this form along with the compliance plan information required. For all emission units at the facility that are operating in compliance with all applicable requirements, complete the following:

- This facility will continue to be operated and maintained in such a manner as to assure compliance for the duration of the permit, except those emission units referenced in the compliance plan portion of this application.
- For all emission units subject to any applicable requirements that will become effective during the term of the permit, this facility will meet such requirements on a timely basis.
- Compliance certification reports will be submitted at least once per year. Each report will certify compliance status with respect to each applicable requirement, and the method used to determine the status.

**Compliance Activity Description**

The maximum annual potential (MAP) for NOx is 275 tons per year combined for the two MWC units, and is based on a 12 month rolling average. To demonstrate compliance with the 275 tons/year MAP limit a continuous stack gas flow monitor will be installed on each MWC unit. This annual limit was modified from the previous limit as part of the NOx RACT demonstration. The facility will comply with an alternative annual NOx limit of 165 ppmv, dry corrected to 7% oxygen and 24-hour short term limit of 185 ppmv, dry corrected to 7% oxygen.

*Re: Wheelabrator Hudson Falls NO<sub>x</sub> RACT  
NYSDEC Permit ID 5-5344-00001/00016  
C.T. Male Project No. 19.9051  
Final NO<sub>x</sub> RACT Analysis Submittal*

Dear Mr. Wood:

C.T. Male Associates Engineering, Surveying, Architecture, Landscape Architecture & Geology, D.P.C. (C.T. Male) is submitting this correspondence on behalf of Wheelabrator Hudson Falls LLC (Wheelabrator). This document and attachments are being submitted in accordance with the requirements of 6 NYCRR Part 219-10. This final analysis includes information from our June 30, 2021 NO<sub>x</sub> RACT submittal, responses to NYSDEC's comments on that submittal provided on August 23, 2021 and additional information and data analysis requested by NYSDEC to complete the review of the NO<sub>x</sub> RACT analysis for the Wheelabrator Hudson Falls facility.

## **6 NYCRR Part 219-10 Requirements**

6 NYCRR Part 219-10, Reasonably Available Control Technology (RACT) for Oxides of Nitrogen (NO<sub>x</sub>) at Municipal and Private Solid Waste Incineration Units includes the following limitations:

- a. Per Table 1 - Emissions of NO<sub>x</sub> on a 24-hour arithmetic average basis, excluding periods of start-up, shutdown, and malfunction will be limited to 150 ppmv, dry corrected to 7% oxygen (mass burn waterwall combustion technology); and
- b. Per Table 2 - Emissions of NO<sub>x</sub> on an annual average basis, excluding periods of start-up, shutdown, and malfunction will be limited to 150 ppmv, dry corrected to 7% oxygen (mass burn waterwall combustion technology).

6 NYCRR Part 219-10.2 (d) requires that the owner or operator of a facility subject to the requirements of the Subpart submit to the Department by June 30, 2021 either a complete application for a permit that incorporates the requirements of the Subpart or a

RACT analysis that explains why the control technology at the facility currently employs should be considered RACT for that emission source. This final letter submittal explains why the NOx control technology currently employed at the Wheelabrator facility should be considered RACT based on a cost analysis conducted in accordance with NYSDEC program policy. Further, additional data analysis indicates that lower NOx limits can be achieved with the existing control technology and as such alternative NOx limits are proposed.

## Description of Facility NOx Control Technology

The current NOx control technology employed at the Wheelabrator facility consists of low excess air/modified staged combustion controls which minimize NOx formation during waste combustion while simultaneously maintaining good combustion efficiency. Such combustion-based NOx control minimizes NOx formation by limiting excess air (oxygen) in the primary combustion zone or pyrolysis zone at the grate level which minimizes conversion of nitrogen in the waste to NOx. Further secondary air is injected at two different furnace elevations (approximately 7 ft apart) above the grates to gradually complete combustion while reducing peak flame temperature minimizing thermal NOx formation from nitrogen in the combustion air. The Foster Wheeler boiler/Detroit stoker grate design combined with the automatic combustion control scheme have proven to be very effective in controlling NOx emissions as demonstrated by the low annual average NOx concentrations for the previous three calendar years. As shown in the table below average NOx concentrations ranged from approximately 149 to 166 ppmv, dry corrected to 7% oxygen, well below the facility's current NOx permit limit of 205 ppmv, dry corrected to 7% oxygen (Conditions 25 and 72 of the Air Title V Permit).

Year	Unit 1 Average	Unit 2 Average
2018	149 ppmv dry corrected to 7% O <sub>2</sub>	166 ppmv dry corrected to 7% O <sub>2</sub>
2019	158 ppmv dry corrected to 7% O <sub>2</sub>	161 ppmv dry corrected to 7% O <sub>2</sub>
2020	157 ppmv dry corrected to 7% O <sub>2</sub>	158 ppmv dry corrected to 7% O <sub>2</sub>

## Review of Alternative NOx Control Technologies

Wheelabrator is familiar with various types of NOx control technologies and did not identify technically feasible NOx control alternatives other than Selective Non-Catalytic Reduction (SNCR)-based and Selective Catalytic Reduction (SCR)-based NOx control systems that have been successfully demonstrated on MWCs. Of these two technologies only SNCR has been successfully retrofitted on a mass-burn waterwall municipal waste combustor (MWC) to meet the USEPA large MWC MACT standards and further optimized to meet NOx RACT requirements. SNCR based NOx control systems have proven year after year to be highly effective, reliable, and technically

## C.T. MALE ASSOCIATES

*Mr. Kevin Wood, P.E.*

*December 14, 2021*

*Page - 3*

feasible for reducing NO<sub>x</sub> emissions in MWC applications. SCR is considered Lowest Achievable Emission Rate (LAER)/Best Available Control Technology (BACT) NO<sub>x</sub> control for new MWCs under the PSD/NSR program and would not be considered RACT given SCR's significantly higher capital and operating cost compared to SNCR that would put SCR cost effectiveness well beyond the RACT threshold as a practical matter.

Further, a search of USEPA's RACT/BACT/LAER Clearinghouse (RBLC) for NO<sub>x</sub> controls determined to be RACT for MWC permits issued in the past 20 years identified only two (2) applications of NO<sub>x</sub> controls to MWC facilities which were determined to be RACT. These facilities are:

1. RBLC ID: VA-0329 - Covanta Alexandria/Arlington Inc., Arlington, VA. This facility has three (3) Keeler/Dorr-Oliver municipal waste combustion (MWC) units; water wall boilers with integrated reciprocating grate stokers. The NO<sub>x</sub> control method is listed as: furnace design, proper operation, good combustion practices, ammonia injection (SNCR), and proprietary low NO<sub>x</sub> combustion system.
2. RBLC ID: VA-0330 - Covanta Fairfax Inc., Fairfax, VA. This facility has four (4) municipal waste combustors (MWC), identical Ogden-Martin equipped with Martin-Stoker boiler system with integrated reciprocating grate stokers and water walls. The NO<sub>x</sub> control method is listed as: furnace design, proper operation, ammonia injection (SNCR), and proprietary low NO<sub>x</sub> combustion system.

In summary of the RBLC data for the previous twenty (20) years, only two (2) cases of RACT for MSW combustors were determined, both consisting of SNCR systems.

Three (3) additional alternative NO<sub>x</sub> control technologies identified by NYSDEC were evaluated including Flue Gas Recirculation (FGR), Natural Gas Injection (NGI) and Baghouse with catalytic bags but were each ruled out. Detailed information on these alternative technologies is provided in Attachment A.

### **Cost Effectiveness of Technically Feasible Control Technologies**

Proposals from 2 vendors that supply SNCR based NO<sub>x</sub> control systems; Fuel Tech (FT) and Hitachi Zosen Inova (HZI) were used in the final RACT cost analysis. Wheelabrator limited the search to SNCR system suppliers who have a proven track record. FT has provided urea based SNCR systems at eleven (11) of the Wheelabrator MWC plants as

## C.T. MALE ASSOCIATES

Mr. Kevin Wood, P.E.

December 14, 2021

Page - 4

required to meet the USEPA NSPS/MACT limits beginning in 1994 including the Wheelabrator Westchester MWC plant in Peekskill, NY. Each of these SNCR systems were further modified/optimized to meet 150 ppmv, dry corrected to 7% oxygen NOx RACT based limits in CT, NH, NJ, MD, MA and PA, and in the next year at the Wheelabrator Westchester MWC plant. The other vendor, HZI, has extensive experience in providing aqueous ammonia based SNCR systems at multiple massburn MWC plants in Europe and around the world. HZI will be retrofitting an advanced aqueous ammonia based SNCR system at the Wheelabrator Baltimore MWC plant that will be fully operational in December 2023. From Wheelabrator's experience, given their proven track record, these were the best companies who could provide the most cost effective SNCR systems for Hudson Falls. Additional details on the cost analysis include:

- 20 years of useful life expectancy was used for calculating capital costs.
- Price quotes from both vendors reflected duplicate/shared services between vendors and plant including cost of engineering & design, commissioning, construction, equipment purchases as would be expected to minimize expenditures in any capital project.
- The SNCR system equipment installation and plant integration costs were purposely omitted from each vendor's scope as this could be performed by the plant using their own local vendors/suppliers as well as own plant personnel at lower cost.
- Both vendors' systems provide common reagent storage tanks and reagent circulation systems within the design. Both SNCR systems do not require reagent preparation as reagent is used in unaltered from what is delivered to the plant.

The final NOx RACT cost analysis is included in Attachment B.

### **RACT Cost Effectiveness Threshold**

The technical requirements of the NYSDEC issued Program Policy DAR-20: Economic and Technical Analysis for Reasonably Available Control Technology (RACT) Networks was reviewed and used to provide guidance on establishing the current facility NOx control technology as RACT. Based on this document, the NYSDEC established a cost effectiveness threshold of \$3,000 per ton of NOx removed in 1994. Escalating the original 1994 RACT cost effectiveness threshold to 2021 using the U.S. Bureau of Labor Statistics CPI Inflation Calculator results in a current RACT cost effectiveness threshold of approximately \$5,475 per ton of NOx removed. The document further explains that: "An emission source of VOC or NOx will not be required to

## C.T. MALE ASSOCIATES

Mr. Kevin Wood, P.E.

December 14, 2021

Page - 5

implement any emission reduction or control strategy that is more costly than the established threshold adjusted over time for inflation”.

### RACT Economic Analysis

To achieve the NO<sub>x</sub> RACT of 150 ppmv, dry corrected to 7% oxygen, the facility would need to design, engineer, procure, and install a Selective Non-Catalytic Reduction (SNCR) NO<sub>x</sub> control system. The table below summarizes the economic analysis for the SNCR NO<sub>x</sub> control system based on the final NO<sub>x</sub> RACT cost analysis detailed in Attachment B.

	PTE NO <sub>x</sub> ppmv (dry corrected to 7% Oxygen)	<b>165</b>	<b>160</b>
	Stack Flow- dscf/min7%O <sub>2</sub> (2018)	28,002	28,002
	PTE NO <sub>x</sub> (2 units)- TV permit (tons)	290.0	281.2
	Annual NO <sub>x</sub> at 150 ppm-(tons)	263.6	263.6
	NO <sub>x</sub> Reduction (tons)	26	18
<b>Fuel Tech (FT)</b>	<b>Total Annualized Cost</b>	<b>\$ 236,602</b>	<b>\$ 236,602</b>
	<b>Cost Effectiveness(\$/ton)</b>	<b>\$8,976</b>	<b>\$13,464</b>
<b>Hitachi Zosen Inova (HZI)</b>	<b>Total Annualized Cost</b>	<b>\$ 235,676</b>	<b>\$ 235,676</b>
	<b>Cost Effectiveness(\$/ton)</b>	<b>\$8,941</b>	<b>\$13,411</b>
	<b>DAR -20 Cost Threshold (\$/ton)</b>	<b>\$5,475</b>	

The cost effectiveness was calculated based on reducing NO<sub>x</sub> concentrations down to 150 ppmv, dry corrected to 7% oxygen from a proposed annual alternative NO<sub>x</sub> limit of 165 ppmv, dry corrected to 7% oxygen and from current NO<sub>x</sub> levels of 160 ppmv, dry corrected to 7% oxygen which represents the average NO<sub>x</sub> concentration for both combustors over the previous 2-3 years. The annual potential to emit (PTE) values in the above table are based on worst case historical gas flow from 2018 annual stack testing (28,002 dscf/min). The 2018 stack gas flow is 11% greater than the gas flow used to establish maximum annual potential emission in the Title V operating permit (25,167 dscf/min). As indicated in the above table above, the costs for reducing NO<sub>x</sub> emissions to 150 ppmv, dry corrected to 7% oxygen are well above the cost effectiveness threshold established following the NYSDEC’s policy document DAR-20: Economic and Technical Analysis for Reasonably Available Control Technology (RACT) Networks.

### Proposed Alternative NO<sub>x</sub> RACT Limits

Based on the October 8, 2021 data analysis submitted to NYDEC, and follow-up discussions between NYDEC and Wheelabrator Hudson Falls, the following alternative NO<sub>x</sub> limits are proposed:

## C.T. MALE ASSOCIATES

Mr. Kevin Wood, P.E.

December 14, 2021

Page - 6

- MWC unit limit of 165 ppmv, dry corrected to 7% oxygen based on 12 month rolling average;
- MWC unit limit of 185 ppmv, dry corrected to 7% oxygen based on 24-hour daily average excluding startup/shutdown and malfunction periods; and
- Maximum Annual Potential (MAP) limit of 275 tons/year combined for the two MWC units based on 12 month rolling average.

To demonstrate compliance with the 275 tons/year MAP limit a continuous stack gas flow monitor will be installed on each MWC unit.

In addition, the use of the natural gas burner will be allowed as may be needed from time to time to assist in meeting the 185 ppm/24-hour daily limit.

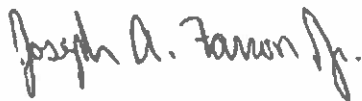

### Alternative NO<sub>x</sub> RACT Summary

In summary, the current NO<sub>x</sub> control technology employed at the facility should be considered RACT given the inherently low NO<sub>x</sub> emissions that are already being achieved and that the cost of further NO<sub>x</sub> reductions greatly exceeds NYDEC's established RACT implementation policy. Additionally, Wheelabrator Hudson Falls is committing to an alternative annual NO<sub>x</sub> limit of 165 ppmv, dry corrected to 7% oxygen and 24- hour short term limit of 185 ppmv, dry corrected to 7% oxygen for each MWC unit and annual MAP limit of 275 tons/year, 12-month rolling average for the facility. These lower limits will reduce the facility's potential to emit and ensure that the NO<sub>x</sub> control technology employed at the facility controls future NO<sub>x</sub> emissions consistent with the requirements of RACT.

Should you have any questions or require additional information, please feel free to contact this office at (518) 786-7400 or Bob Brynes of Wheelabrator at (518) 747-2390 extension 217 at your convenience.

**Attachment A**

**Additional NO<sub>x</sub> RACT Technology  
Feasibility Analysis**

## **Attachment A- Additional NOx RACT Technology Feasibility Analysis**

### **Flue Gas Recirculation (FGR):**

In FGR a portion of clean combustion flue gas is extracted and recirculated from the ID fan inlet duct after air pollution control train and is re-injected back into the furnace through the secondary air (SA) system. The recirculated flue gas replaces a portion of the secondary air flow, reducing O<sub>2</sub> concentration in the combustion zone while maintaining the SA gas flow volume and velocity needed for good turbulence and mixing of SA and flue gas in the furnace. The addition of FGR reduces NO<sub>x</sub> generation by lowering combustion zone O<sub>2</sub> and suppressing flame temperature. The negative aspect of FGR however is the potential for an increase in CO emissions from lower O<sub>2</sub> concentrations in the combustion zone.

From a technical and practical perspective FGR was not considered given the already low NO<sub>x</sub> emissions inherent to the Hudson Falls MWC furnace design and combustion control. As described in the June 2021 RACT proposal, the Hudson Falls MWCs equipped with Foster-Wheeler boilers and Detroit Stoker reciprocating grates have secondary air (SA) systems with two fully interlaced SA injection levels with 7 feet vertical separation between them. This additional SA stage extends the combustion zone helping to further reduce peak flame temperature and incrementally increases available O<sub>2</sub> to help minimize NO<sub>x</sub> formation while ensuring good CO control. Baseline NO<sub>x</sub> levels in massburn waterwall/reciprocating grate MWCs are generally in the 240-300 ppm<sub>7%</sub> range using low excess air/single staged combustion. Expected FGR NO<sub>x</sub> reduction is approximately 20-25% from baseline NO<sub>x</sub> levels putting expected FGR NO<sub>x</sub> concentrations in the 165-225 ppm<sub>7%</sub> range. Average NO<sub>x</sub> concentrations for the Hudson Falls MWC units are already at or below the expected NO<sub>x</sub> levels that could be attained with FGR. As such installation of FGR would likely provide little or no additional NO<sub>x</sub> reduction and would not be a viable option for achieving lower NO<sub>x</sub> levels at the facility.

### **Natural Gas Injection (NGI)**

NGI was never identified as a technically feasible commercially available NO<sub>x</sub> control option and has never been retrofitted on a MWC to our knowledge. Further NGI was not identified as a RACT based control technology in the USEPA RACT/BACT/LAER clearing house. NGI basically involves the injection of natural gas in the combustion zone to create reducing conditions that convert NO<sub>x</sub> formed in combustion zone to CO, N<sub>2</sub> and water. Short duration tests of NGI were conducted in the past but the technology was never adequately developed and demonstrated to be considered ready for commercial applications. (*USEPA Project Summary NO<sub>x</sub> Control Technologies Applicable to Municipal Waste Combustion, EPA/600/SR-94/208, March 1995*). Additionally, NGI would reduce the waste processing capacity of the facility as the heat released from the eventual combustion of natural gas, would displace the heat released from MSW combustion. A reduction in waste processing capacity would adversely impact facility economics. Based on the above, NGI would not be considered technically feasible for NO<sub>x</sub> RACT control option.

### **Baghouse with Catalytic Bags:**

A Pulse Jet Fabric Filter (PJFF) or baghouse equipped with catalytic filter bags with ammonia or urea injection operates similarly to "traditional" Selective Catalytic Reduction (SCR) NO<sub>x</sub> control system. A catalytic filter bag is comprised of a PTFE membrane bag on the outside layer for particulate removal with SCR catalyst embedded fabric on the inside. As with SCR minimum operating temperatures for catalytic filter bags range from 356°F to 430°F but is highly dependent on flue gas constituents. The most significant challenge to applying catalytic bags on MWCs is the high operating temperature needed for the catalytic NO<sub>x</sub> reduction reaction to occur and the presence of SO<sub>2</sub> in the flue gas.

Optimum temperature range for SO<sub>2</sub> and HCl removal is 150°C to 180°C (275°F to 350°F) for the spray dryer absorber (SDA) acid gas control technology installed at Hudson Falls which is too low for catalytic bags to be effective for NO<sub>x</sub> control. Further, at these lower SDA operating temperatures, catalyst activity will be reduced quickly from ammonium bisulfate formation and deposition from SO<sub>2</sub> in the flue gas combining with ammonia. Increasing SDA operating temperature to meet the catalytic filter bag temperature requirement greatly reduces SO<sub>2</sub> removal capability and the ability to meet SO<sub>2</sub>/HCl limits. Additionally, as the USEPA has indicated in evaluating mercury control in MWCs, when flue gas temperatures approach and exceed 350°F, the effectiveness of powdered activated carbon (PAC) is reduced

rapidly. An increase in baghouse temperature from 300°F to 350°F during one study reduced mercury removal from approximately 90% to 10 to 20%.

Finally, the cost of replacing the existing ESPs with pulse jet baghouses has been estimated at approximately \$6.9 million in 2018 dollars (estimate from baghouse supplier). This estimate included removing the ESPs and installing 2 new baghouses. The estimate did not include facility costs for engineering and construction to integrate the baghouses into the facility. The cost of catalytic bags would be additional as would installation of an ammonia injection system to supply ammonia required for the catalytic reduction reaction.

**Attachment B**

**Wheelabrator Hudson Falls NO<sub>x</sub> RACT  
Cost Summary**

## **Attachment B- Wheelabrator Hudson Falls NOx RACT Cost Summary**

Cost analysis is based on recent proposal from Hitachi Zosen Inova (HZI, July 2021) for 19% aqueous ammonia (NH<sub>3</sub>) based SNCR system and Fuel Tech (FT) April 2018 proposal for urea based SNCR system. Fuel Tech 2018 proposal cost was not escalated from 2018 to 2021 basis to be conservative.

### **Scope of Work:**

#### **SNCR System Components (Common components except as noted)**

- Double wall ammonia storage tank (HZI)
- Heated 50% urea tank with heated recirculation module (FT)
- Recirculation pumping system to supply reagent to metering/distribution modules (common to both MWC units)
- Reagent metering control modules (2)
- Reagent distribution modules (2)
- Reagent injectors
  - HZI, 3 injectors per MWC, 6 total
  - FT, 4 injectors per MWC, 8 total
- Instrumentation
- Engineering
- Testing/commissioning

#### **Installation/Services Provided by Plant-not included in vendor scope of work**

- Mechanical and/or electrical installation of supplied equipment
- Integration into plant control, mechanical and electrical system
- Electrical design for power and control wiring
- Reagent tank foundation
- Civil engineering and civil works
- Power supply cable and wiring
- Planning and permitting
- Local sales taxes
- LOTO (lockout-tagout)
- Bent furnace tubes and wall boxes for injectors
